                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1, Application US/09103840A

Sequence 1, Application US/09103840A

Patent No. 6294328

GENERAL INFORMATION:

APPLICANT: FIEISCHMAN, Robert D.

APPLICANT: WHITE, Owen R.

APPLICANT: VENERR, John C.

TITLE OF INVENTION: TUBERCULOSIS

TITLE OF INVENTION: TUBERCULOSIS

TITLE OF INVENTION: TUBERCULOSIS

TITLE OF INVENTION NUMBER: US/09/103,840A

CURRENT APPLICATION NUMBER: US/09/103,840A

CURRENT FILING DATE: 1998-06-24

NUMBER OF SEQ INOS: 2

SOFTWARE: PatentIn Ver. 2.1

SEQ ID NO 1.2.2

Patent No. 5525463
GENERAL INFORMATION:
APPLICANT: 2019, Werner
TITLE OF INVENTION: Methods and reagents for detection of
TITLE OF INVENTION: pathogens using superoxide dismutase gene
TITLE OF INVENTION: targeting
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                  | SIDSZ/godatu/geneseq/geneseqn-embl/NA1980.DAT:*

                                      The sequence is that of an example randomising oligonucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts. See also AAQ21830-Q21832.

SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune of the epitope commonly recognised by the antisera from autoimmune of the antisera from autoimmune of the allowan epitope composed of a Tormonol. 144, 4633, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone H2B consists of ca. 10 amino acids at the N-terminus of the histone H2B consists of a Tormoner sequence and a ribosome binding sequence composed of a Tormoner sequence and a ribosome binding stee which is recognised by both prokaryotic and autonome binding stee which is restriction endonuclease site is synthesised and cloned terminating in a restriction endonuclease site is synthesised and cloned is placed into a restriction site to provide an mRNA encoding the C-is placed into a restriction site to provide an mRNA encoding the C-is placed into a restriction site is provided so that cDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesising a nucleic acid mixture comprising mRNA having translatable each on-translatable regions and a mixture of nucleic acid polypeptide coopolymers, each comprising the mRNA and a polypeptide encoded by its associated mRNA. The copolymers are partitioned relative to their affinity to the target. The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptide solution by reverse translation (SPERT). The polypeptide solution by reverse translation of target molecule function, as probes, as drug delivery vehicles and modifiers of target molecules include natural and synthetic polymers. The target target molecules include natural and synthetic polymers, including proteins, hormones, receptors and cell surfaces, nucleic acids and small concludes such as drugs, metabolites, cofactors and toxins. Polypeptide
                                                                                                                                                          Isolating a polypeptide ligand to a target molecule, useful for diagnostic assays, comprises partitioning candidate mixtures comprised of ribosome complexes or mRNA.polypeptide copolymers relative to their affinity to the target molecule
                                                                             Smith JD;

Oligo #7 for cloning T7 promoter and RBS containing mRNA.

17 promoter; ribosome binding site; RBS; prokaryotic; eukaryotic; ribosome; mRNA.circle-solid.polypeptide copolymer; mRcs.pC; SPERT; Systematic Polypeptide Evolution by Reverse Translation; assay; diagnosis; cell sorting; inhibitor; probe; sequestering agent; ribosome complex; ss.

```
The sequences given in AA172769-81 are oligonucleotides which were used to make mRNA encoding a candidate polypeptide, a 5' fixed sequence composed of a T7 promoter sequence and a Thosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site. The resulting nucleic acid was used in a restriction endonuclease site. The resulting nucleic acid was used in the method of the livention for preparing ligands of target molecules in which mixtures of ribosome complexes or mRNA.circle-solid.polypeptide on which mixtures of ribosome complexes or mRNA.circle-solid.polypeptide amplified to create candidate mixtures enriched in ribosome complexes command the account of the livention of the target, are new. The methods are useful for isolating polypeptide in ribosome complexes or mRNA.circle-solid.polypeptide except molecules. The polypeptide products are useful for assay methods, diagnostic procedures, cell sorting, as inhibitors of the sperm methods diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents and the carget molecule function, so probes, as sequestering agents and the carget molecule function, so property of the invention can have catalytic activity. Target molecules include natural and synthetic polymers, including proteins, polysecthatides, plysoproteins, bormones, creeptors and cell surfaces, nucleic acids, and small molecules such acting sequence of that polypeptide. The candidate mixture of polymetres including proteins, polysecthatics, of binding to a given desired target molecule. The partitioned according to their property of binding to append according to their property of binding to a given desired cach man acid sequence of that polypeptide. The candidate mixture is linked to an individualized mixture mixture and the mans for further amplifying it by an in vitro process. Content and the mans for further amplifying it by an in vitro process. It has the mean according to polypep
                                                                                                                                                                                                                                                                                                                                                                                                                                New methods (termed SPERT (Systematic Polypeptide Evolution by Reverse Translation)) for selecting high-affinity polypeptide ligands that specifically bind target molecules, e.g. proteins, carbohydrates, toxins, drugs and receptors
                                                                                                                                                                                                                                                                                                                                                           Smith JD;

```
The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, why cobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AA199683) and H37RV (AA199682). The method is useful for evaluating strain of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen.

Mycobacterium tuberculosis or related Wycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1531 (AA199683) and H37Rv (AA199682). The method is useful for evaluating strain variation of tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in th genome corresponding to positions where M. tuberculosis strains CDC 1551 and H37Rv differ -

The protein is expressed in the central nervous system. The SREB products are used for the diagnosis and treatment of diseases of the central nervous system, including inflammatory disorders of immunological origin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                    corpus of protein-coupled receptor (GPCR), expressed in foetal brain, putamen, pitulitary gland and caudate nucleus. The hGPCR27 cDNA was identified using EST (expressed sequence tag) AA775870 as a probe. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular c-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the cidentification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               97 recentactaccageaegregactactecresageaegreaegresereseres 156

The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  277 ACGGCTTCGTGGTGCGCGAGACCAGGGTCGAAGAGGACATCAACACCTGCACCGGCGAGG 336

                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of identifying an agent that binds to and/or modulates activity of human G-protein coupled receptor (GPCR) 14266. The invention also provides a method for modulating the level or activity of the GPCR in cells in vivo or in vitro, or in a subject disorders. Detecting 14266 polypeptides or neutrophil deficiency disorders. Detecting 14266 polypeptides or nucleic acids in specific biological samples is useful in disease disponais. Modulating level or activity of the GPCR polypeptide or polynuclectide is useful for treating spleen (e.g. splenomegaly, neoplasms); lung (e.g. pulmonary hypertension, emphysema); colon (e.g. disarhoea and disease); liver (e.g. hepatic injury, viral hepaticis); uterus and endometrium (e.g. endometricasis, endometrial adgemention); caute meningitis, multiple sclerosis, splinocerebellar degeneration); T-cells (e.g. vitiligo, acanthosis nigricans); heart (e.g. heart failure,
                                                                                                                                                                        Human; G-protein coupled receptor; GPCR 14266; haematopoietic disorder; neutrophil deficiency disorder; splenomegaly; pulmonary hypertension; colon; diarrhoea; hepatic injury; idiopathic inflammatory bowel disease; uterus; endometriosis; brain; acute meningitis; multiple sclerosis; T-cell; systemic lupus erythematosus; skin; vitiligo; heart failure; angina pectoris; atherosclerosis; haemolytic anaemia; thymic cyst; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying compound that binds to and/or modulate activity of the polypeptide for treating splenomegaly, emphysema and multiple sclerosis, comprises using human G-protein coupled receptor 14266
                                                                                                                                                                                                                                                                                                                                          /*tag= b

                                                                                                                                                                                                                          RBS
                                                                                                                                                                                                                                                                                                                                                              RBS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RBS
                                                                                                                              The invention relates to an isolated polypeptide encoded by a nucleic acid molecule that is at least 80% identical to the G nucleic acid molecule that is at least 80% identical to the G nucleic acid molecule that is at least 80% identical to the G protein-coupled (GPCR) polymorleotides included in the specification.

Also included are probes based on the GPCR sequences (including attisense probes), a host cell comprising an expression vector comprising the GPCR sequence, antibodies raised against the polypeptides. The Compounds which polypeptides are useful for identifying modulator compounds which polypeptides are useful for identifying modulator compounds which of the novel GPCR polypeptides including the GAL4 polypeptide. The antibodies and nucleic acids and are used to detect the presence of the polypeptides and nucleic acids and are used to diagnose a variety of diseases as described above can be used to diagnose a variety of diseases or disorders in which GPCRs are involved c.g., Alzhelmer's disease, amyotrophic lateral sclerosis, asthma, chonic obstructive pulmonary disease, carcinoma, cardiomyopathy, chondrosarcoma, chronic obstructive pulmonary disease, acarcinom, pulmonary disease, carcinom, melanoma, melanoma, melanoma, procederosis, past became to the propession, epilepsy, macular degeneration, lymphoma, melanoma, procederosis, past became to the propession, epilepsy, macular degeneration, lymphoma, melanoma, procederosis, past probes and antibodies are also useful for diagnosing cognition and memory disease, and antibodies are also useful for diagnosing cognition and memory disease, and antibodies are also useful for diagnosing and memory disease, and antibodies are also useful for diagnosing and antipolation and memory disease and antibodies are also useful for diagnosing and anti-private and antipolation and and antipolation and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            97 TGGCTTACTACCAGGAGGTGGACTACTGCTCGGAGGAGGTGAGGTCGGTGGCCCCGGCCG 156

Preferably, compounds that decrease or increase the expression of galanin receptor (GAL4) can be used to treat obesity, diabetes, hyperlipidaemia and stroke. The GPCR nucleic acid is useful for treating the above mentioned disorders by gene therapy techniques. The present sequence is a novel GPCR polynucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         157 GCTTCGGCCGCCACGGCGGCGGCGTCCAGCACGTCGTCAAGGAGAAGTTCGAGGAGG

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene
con-coding regions of RNAs carcinomes on borders, the
initiation codons, genomic flanking regions, intron-exon borders, the
confidence diseases, conditions or mixtures. The antisense oligonucleotides
common diseases, conditions or mixtures. The antisense oligonucleotides
common genence AAX55180-271, can be used for the
antisense treatment of diseases and conditions. Typical diseases and
conditions are those associated with impaired respiration and
conditions are those associated with impaired respiration and
conditions allergic rhinitis, acute asthma, allergies, asthma, impeded
respiration, including lung disease, pulmonary vasoconstriction,
conditions allergic rhinitis, acute asthma, allergies, asthma, impeded
respiration, allergic rhinitis, acute asthma, allergies, asthma, impeded
conditions allergic rhinitis, acute asthma, allergies, acute
conditions allergic rhinitis, acute asthma, allergies, asthma, impeded
conditions are those associated with impaired respiration, painconstriction,
confidence associated with impaired solutions, paincers, lung cancer,
confidence associated to the lungs, including breast and prostate cancer.

(see also AAR92692). It was obtd. by amplification of the cloned isoamylase gene (AAT10428) using primers (AAT10423-33) designed to add a start codon to the beginning of the processed mature enzyme (Ala-33) and a stop codon adjacent to the endogenous TGA codon. The DNA sequence is used for the recombinant prodn. of isoamylase or can be expressed in transgenic plants, e.g. potato, cassava, sweet potato, corn, wheat, barley or rice, to alter the amylose:amylopectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated DNA encoding isoamylase - used to produce plants having a modified starch content, e.g. a higher ratio of amylose to

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The genomic sequence was searched against (ftp://noth.inlm.inl.gvv/blast/db) and the cDNA sequence database at RGP. Protein homologies of the coding regions were searched against the identified cDNA sequences using BLASTRY 2.0 with the corresponding DDBJ accession no. and RGP clone ID.

A gene with identity or significant homology to a protein is classified as a moverland same name, 'unknown' protein any protein but with EST homology (covering significant homology to any protein but with EST homology (covering significant homology to any protein mare to indicate the homology to any protein but with sequence of P0456E05 clone has an overlap with p0470Al2 (DDBJ: Ap003436) at the position 130,058 to 173,699 of 3' end Detailed annotation of this entry is savallable at an information of this entry is available at an information of this entry is available at the homology than affreqo.jp/GenomeSeq.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  **NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

On Oct 17, 2001 this Sequence Varsion replaced gi:1343001.

Genes Ware predicted from the integrated results of the following: GRNSCANI.0, BLASTNZ.0 as well as SplicePredictor Genes Ware Protein Actabase, nr Replaced Tesults of the following: GRNSCANI.0, BLASTNZ.0 as well as SplicePredictor (Cotober 1998 Version. The genomic Sequence Was Searched against NoTEI NonRedundant Protein database, nr the CDNA Sequence database at (ftp://ncbi.nlm.nih.gov/blast/db) and the CDNA Sequence using BLASTN 2.0 with the corresponding DDNJ accession no. and KBC clone in A gene with identity or significant homology to any protein but with EST homology (covering significant homology to any protein but with a gene prediction protein almost the entire length of partial sequence) is classified as any hypothetical' protein.

The orientation of the sequence is from SP6 to 77 of the PAC clone. The orientation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html.

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length Usually the highest socring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene specially developed Hidden Markov Model (Krogh et al., Nucleic of Bibb et al., Gene 30:157-66(1984) and the Frameplot program http://www.nih.go.jp/
Jun/Cqi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation ribosome binding site sequence (optimally 5-13bp before the most initiation codon). If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most initiation codon. If this cannot be identified we choose the most sequenced clone. It may be shorter because we arrange for a sequenced clone. It may be shorter because we arrange for a small overlap between neighbouring submissions. Cosmid 3A7 lies between 10H5 and 4A2 on the Asel-B genomic restriction fragment.
                                                                                                                                                                                                            BCT 12-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequencing project,

Streptomyces coelicolor sequencing at The Sanger Centre is funded by the BBSRC.

Betails of S. coelicolor sequencing at the Sanger Centre are available on the World Wide Web.

(URL; http://www.sanger.ac.uk/Projects/S_coelicolor/) CDS are numbered using the following system eg SC787.01c. SC (S. coelicolor), 787 (cosmid name), .01 (first CDS), c (complementary
                                                                                                                                                                                                                                                                                                                              3-oxoadipate enol-lactone hydrolase/4-carboxymuconolactone decarboxylase; ABC transporter; beta-galactosidase; exonuclease; IS3 type transposase; secreted amidase; secreted chitinase; two-component sensor/regulator. Streptomyces coelicolor A3(2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Redenbach, M., Kleser, Kinashi, Denapaite, D., Elchner, A., Cullum, J., Kinashi, H. and Hopwood, D.A.
A set of ordered cosmids and a detailed genetic and physical map for the 8 Mb Streptomyces coelicolor A3(2) chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 (bases 1 to 35100)

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta o is given for The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the Frameplot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/Cgl-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Here possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream initiation codon.

IMPORTANT: This sequence (optimally 5-13bp before the upstream initiation codon. If this cannot be identified we choose the most language sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid StBAC28G1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2. .94

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al. codons using a Acids Research, 22(22):4768-4778(1994)) and the Frameplot program http://www.nih.go.jp/
jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IMPORTANT: This sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions. Cosmid C30 overlaps cosmid C75 on the Asel-c genomic restriction fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Complement(681. 1661)

identity in 286 as overlap. Contains 2x Pfam match to entry PF00892 DUF6, integral membrane protein and possible hydrophobic membrane spanning regions"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene where these have been used to deduce the initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /db_xref="SPTREME.jou."

Tel:81-2002 this sequence version replaced gi:16904696.
Genes were predicted from the integrated results of the following:
GRNSCANI.0, ELASTNI.0, BLASTNI.0 as well as Splicepredictor
(October 1998 version). The genomic sequence was searched against
NCBI NonRedundant Protein database, nr
(ftp://ncbi.nlm.nin.gov/blast/db) and the cDNA sequence database at
(REP. Protein homologies of the coding regions were searched against
(REP. Protein homologies of the coding regions were searched against
NCBI NonRedundant Protein database with BLASTP2.0. ESTS represent
the identified CDNA sequences using BLASTN 2.0 with the
corresponding DDBJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein is
classified based on the protein name to indicate the homology lovel
such as same name, 'putative-' and '-11ke protein'. A gene without
slighticant homology to any protein name to indicate the homology covering
such as same name, 'putative-' and '-11ke protein'. A gene without
slighticant homology to any protein name to indicate the homology covering
unknow' 'protein. A gene predicted with a gene prediction program
is classified as a 'hypothetical' protein.
The orientation of the sequence is from Milysev to -21Mi3 of the BAC
Clone. This sequence of Bl147A04 clone has an overlap with P0431G06
(DDBJ: AP003683) clone at the position 141,300 to 142,730 of
end. The sequence of this clone ends at the position by 754 of
P0431G06. Detailed information on overlap and assembly quality
together with annotation of this entry is available at

The nucleotide sequence of this BAC clone was generated by
Combining Monsanto and RGP-Japan Sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

** This sequence will be replaced

** by the finished sequence as soon as it is available and

** the accession number will be preserved.
